Survival in cardiac arrest

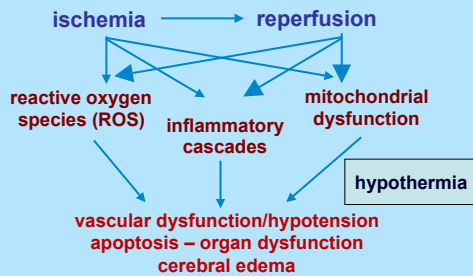

Reperfusion injury

Damage observed after restoration of blood flow to ischemic tissues

Reperfusion injury pathways

Key RCTs from 2001-2002

Concept of post-arrest TTM

RCT details

	Multicenter?	Main site	pt rhythm	pt location	N
HACA	YES	Austria	VF	OOH	275
Bernard	YES	Australia	VF	OOH	77
Idrissi	NO	Belgium	PEA/asystole	OOH	30

More RCT details

	Age (years)	Female sex (%)	VF (#)	ROSC (min)	Target temp (°C)	Duration (hours)	Method
HACA	59 (51-68)	65 (24)	254 (92%)	22 (16-30)	33	24	Cool air
Bernard	68 (57-75)	25 (32)	77 (100%)	24 (17-32)	33	12	Ice packs
Idrissi	74 (66-79)	13 (39)	0	33 (27-37)	34	Up to 4	Helmet

HACA temperature curves

HACA, 2002

RCT outcomes

	Hypothermia (%)	Normothermia (%)	RR (95% CI)	P value
<i>Alive at hospital discharge with favourable neurological recovery</i>				
HACA	72/136 (53%)	50/137 (36%)	1.51 (1.14-1.89)	0.006
Bernard	21/43 (49%)	9/34 (26%)	1.75 (0.99-2.43)	0.052
Idrissi	4/16 (25%)	1/17 (6%)	4.25 (0.70-53.83)	0.16
<i>Alive at 6 months with favourable neurological recovery</i>				
HACA	71/136 (52%)	50/137 (36%)	1.44 (1.11-1.76)	0.009

AHA guidelines

Comatose out-of-hospital VF:
Class IIa recommendation

2010: Changed to Class I

In-hospital arrest, other rhythms:
Class IIb recommendation

2010: Still Class IIb

Example of "real world" study

From evidence to clinical practice: Effective implementation of therapeutic hypothermia to improve patient outcome after cardiac arrest® **2006**

Mauro Oddo, MD; Marie-Denise Schalkler, MD; François Feihl, MD; Vincent Ribordy, MD; Lucas Liaudet, MD

Oddo M et al, 2006

Retrospective study at one hospital in Switzerland
Cooling intervention with historical controls
Survivors of out-of-hospital arrest (n=109)
Cooling initially via ice bags, then cooling mattress
Target temperature 33°C, maintained for 24 hrs
All post-arrest ST elevations received cardiac cath

Outcomes for VF patients

Outcome at discharge for out-of-hospital VF arrest

baseline	CPC5 56%	CPC3 19%	CPC2 12%	CPC1 14%
cooling	CPC 5 40%	CPC3 5%	CPC2 14%	CPC1 42%

Outcome for asystole patients

Outcome at discharge for out-of-hospital asystole arrest

baseline	CPC5 89%	CPC3 11%
cooling	CPC5 83%	CPC1 17%

TTM for nonshockable rhythms

Therapeutic hypothermia after cardiac arrest in clinical practice: Review and compilation of recent experiences **2009**

Emily Sagalyn, MD; Roger A. Band, MD; David F. Gaieski, MD; Benjamin S. Abella, MD, MPhil

Author	n		Survival		OR	95% CI
	HC	TH	Historical Control n (%) ^a	Therapeutic Hypothermia n (%)		
Arrich et al (17)	123	462	39 (32)	267 (58)	2.9	1.9-4.6
Belliard et al (21)	36	32	13 (36)	18 (56)	2.3	0.8-6.8

Sunde et al (18)	58	61	18 (31)	34 (56)	2.8	1.2-6.4
Combined ORs					2.5	1.8-3.3

Hypothermia clinical benefit is robust (consistent across Numerous studies)

TTM for nonshockable rhythms

Meta-analysis of hypothermia for non-shockable Rhythms (non-VF/VT)

Kim Y et al, 2012

Nielsen registry study

Hypothermia Network

International Cardiac Arrest Registry (INTCAR) is open

(a) Adverse events: all 34 centres and (b) adverse events: 22 reporting centers.

n = 986	
(a) Bradycardia <40 beats/min	127 (13)
Tachycardia >130 beats/min	87 (9)
Atrial fibrillation	88 (9)
VT	89 (9)
VF	71 (7)
Any combination of arrhythmia	325 (33)
Pneumonia	407 (41)
Sepsis	35 (4)
Other infection	41 (4)
Bleeding requiring transfusion	44 (4)
Intracerebral bleeding	2 (0.2)
Seizures	233 (24)

Nielsen et al, 2009

Bradycardia (13%)
Significant bleed (4%)

TTM and the cath lab

Usefulness of Cooling and Coronary Catheterization to Improve Survival in Out-of-Hospital Cardiac Arrest **2011**

Dion Stub, MBBS^{a,b}, Christopher Hengel, MBBS^a, William Chan, MBBS^{a,b}, Damon Jackson, MBBS^a, Karen Sanders, RN, GradDipEd^a, Anthony M. Dart, BA, BM, BCh, PhD^{a,b}, Andrew Hilton, MBBS^a, Vincent Pellegrino, MBBS^a, James A. Shaw, MBBS, PhD^{a,b}, Stephen J. Duffy, MBBS, PhD^a, Stephen Bernard, MBBS, MD^a, and David M. Kaye, MBBS, PhD^{a,b}

Less than 40% of patients had STEMI; yet huge survival benefits when OHCA patients cathed

Post-arrest awakening

Grossestreuer, 2013

Comparing TTM devices

Table 2 Outcome of the MHI-treated patients (78) presented number (percentage) representing survival, neurological function and cooling-associated complications

	AS (n = 39)	CG (n = 39)	p value
Survival and neurological function according to the Glasgow-Pittsburgh Cerebral Performance Categories			
Survived hospitalization, n (%)	21 (53.8)	24 (61.5)	0.65
CPC ¹ 1/2, n (%)	14 (35.9)	14 (35.9)	0.99
Complications of cooling			
Bleeding complication, n (%)	7 (17.9)	17 (43.6)	0.03
Major bleeding, n (%)	4 (10.3)	14 (35.9)	0.01
Minor bleeding, n (%)	2 (5.1)	3 (7.7)	0.99
Rasteria found in blood cultures, n (%)	17 (43.6)	21 (53.8)	0.90
Sepsis, n (%)	2 (5.1)	4 (10.4)	0.26
Death due to sepsis, n (%)	1 (2.6)	1 (2.6)	1.00
Pneumonia, n (%)	24 (61.5)	28 (71.8)	0.47
Antibiotic treatment, n (%)	28 (71.8)	33 (84.6)	0.16
Therapy necessitating intubation, n (%)	13 (33.3)	12 (30.8)	0.99
Renal failure, n (%)	21 (53.3)	22 (56.4)	0.99

No study has shown significant outcome or adverse event differences between devices

Details of the TTM trial

TTM-trial – 2010-2013

- 950 patients randomized
- 36 hospitals
- 10 countries
- Europe and Australia

Funded by:
 Swedish Heart Lung Foundation
 AFA-insurance Foundation, Sweden
 Swedish Research Council
 Governmental and Regional funding within the Swedish National Health System
 TrygFoundation, Denmark
 Zoega, Krappereup, Thure Carlsson, Trolle-Wachtmeister foundations, Sweden

Characteristics of each group

Baseline characteristics

	33°C	36°C
No.	473	466
Age	64+/-12	64+/-13
Male sex	83 %	79 %
Arrest in place of residence	52 %	55 %
Arrest in public place	42 %	40 %
Bystander witnessed	59 %	50 %
Bystander CPR	73 %	73 %
Shockable rhythm	79 %	81 %
Arrest to ROSC (min)	25 [18-40]	25 [16-40]
Circulatory shock	15 %	14 %
Lactate mmol/L	6.7±4.5	6.7±4.5
ST-elevation infarction	40 %	42 %
GCS	3 [3-4]	3 [3-4]

Outcomes in the TTM trial

Survival

TTM subgroup analyses

Subgroup	Target 33°C	Target 36°C	Hazard Ratio	Hazard Ratio	Test of interaction
	No. of events	Total no. of patients	95% CI	95% CI	
Age					
Less than or equal to 65 years	91/228	85/205	1.13 (0.84, 1.53)		P = 0.52
More than 65 years	144/225	140/276	1.07 (0.88, 1.28)		
Gender					
Female	47/85	5/56	1.14 (0.37, 3.53)		P = 0.75
Male	166/163	170/164	1.07 (0.87, 1.32)		
Time from cardiac arrest to ROSC					
Less than or equal to 25 min	72/83	80/81	1.02 (0.68, 1.54)		P = 0.25
More than 25 min	174/225	170/224	1.25 (0.96, 1.71)		
Initial rhythm					
Non-shockable	40/58	4/46	1.08 (0.19, 5.95)		P = 0.50
Shockable	123/125	120/127	1.06 (0.88, 1.28)		
Shock at admission					
Not present	104/82	92/78	1.03 (0.83, 1.28)		P = 0.57
Present	102/163	144/164	1.09 (0.96, 1.23)		
Site category					
Two target sites	104/10	80/10	1.03 (0.87, 1.21)		P = 0.59
One or no target	160/163	160/158	1.02 (0.83, 1.25)		
TTM trial					
All patients	210/473	209/466	1.06 (0.89, 1.26)		P = 0.51

Key question raised by TTM trial

How can this be?

Temperature curve comparison

Nielsen et al

HACA study

Bernard et al: ~37.3°C

Large difference in maintenance temperatures

2013 TTM trial: key point

2013 TTM trial does **not** test the same hypothesis as the HACA, Bernard trials

36°C arm in the trial is still **active** management of temperature

Overview of post-arrest outcomes

Rationale for our approach

Given that:

- (1) TTM trial was neutral (no differences in benefit or harms)
- (2) Cooling to 33°C is based on extensive laboratory evidence and two RCTs (HACA, 2002; Bernard et al, 2002)
- (3) We can't tell who will have significant post-arrest injury based on current technology and clinical factors
- (4) the chance to modify neurologic injury is in the acute care of post-arrest patients – and we don't get a second chance

Our consensus approach

Therefore:

it is reasonable to not change current practice based on the TTM trial, but rather continue to treat comatose post-arrest patients with a TTM goal temperature of 33°C.

However, the TTM trial provides evidence that a more flexible approach is possible – for patients intolerant of 33°C (marked bradycardia, increased bleeding, marked QT prolongation, e.g.) or for patients that clinicians feel uncomfortable with treating to 33°C for other clinical factors, it is acceptable to treat with higher TTM temperature goals, up to 36°C.

Other key part of our approach

ALL comatose post-arrest patients should at least receive TTM with a maximum temp goal of 36°C – “normothermia” as defined by lack of any temperature control is not supported by the growing body of literature.

In addition to TTM management in the acute phase (12-24 hours of either 33°C or 36°C TTM), all post arrest patients should receive comprehensive best-practice post arrest care, including aggressive avoidance of fever for up to 48-72 hours following rewarming and avoidance of care withdrawal for at least 72 hours post arrest, as supported in the current AHA guidelines and the TTM trial.

Post-arrest care is multimodal

Requires a critical care “bundle”:

- Therapeutic hypothermia
- Careful hemodynamic management
- Coronary intervention if STEMI or high probability of coronary cause
- Neurology consultation and assessment

Post-arrest hypothermia: an implementation problem
